Mathematicians & engineers are familiar with the highly useful  
 concept of operator  $\sqrt{-1}$  - an idea "justified" by the fact

that  $\sqrt{-1} \times \sqrt{-1} = \sqrt{-1}^2 = -1$ . I have been

(mostly!) using this property particular mathematical stage property  
 for over 15 years and still do not understand it. \* ①

I introduce the idea of  $\sqrt{-1}$  not just to add confusion  
 to the already chaos already created by the

statement that  $C = \sqrt{\frac{E}{M}}$ , but to point to

the fact that when ~~became~~ <sup>became</sup> both lead to the

 Its usefulness lies in the fact that it can be  
 used to create worlds of infinite dimensions  
 (and analyze events in) or universes of  
 as many dimensions as the problem to be solved may require  
 One of its interesting properties is that if you multiply  
 an number by  $\sqrt{-1}$ , it becomes "imaginary" - it has  
 no physical significance in its original domain but  
 but repeating the process again the number reappears  
 as a "real" number in its original domain with but  
 now with say in a negative sense. Mathematically  
 $\sqrt{-1} \times \sqrt{-1} = -1$ . The simple Ar. elementary  
 concept of the process is all we really possess but we  
 propagate the idea in colleges & University, that the  
 whole process can be explained by two lines and a dot on the
